

Evaluation Project: Intergalactic Cargo Portal

Timeline: 1 Day

Instructions: By the end of the day, submit each task that is completed in a new thread, and follow the format specified: [Status]: [Task] - [Last Name] - [Keyword].

If you have performed any changes after submission, write in the same thread. Ensure the repo is accessible to review the output. The commit messages should be meaningful and should contain task numbers.

Allowed Stack: Python, Node.js, React, Svelte

AI Policy: You are permitted to use AI tools (ChatGPT, GitHub Copilot, etc.) to assist you. However, blindly copying and pasting AI output can result in failure. Follow instructions carefully.

Project Overview

You are building a full-stack portal with Authentication and Role-Based Access Control (RBAC) to handle legacy cargo manifests. You will complete this over a day, submitting a specific email update at the end of each task.

Task 1: Foundation (Auth & DB)

1. **The Task:** Set up your backend server, database, and create /signup and /login endpoints (JWT or Session-based).
 2. **Roles:** The system requires two user roles: Admin and Standard.
 3. **Business Rule 1 (Provisioning):** Do *not* allow the user to select their role during signup. Instead, if a user signs up with an email ending exactly in @nebula-corp.com, the backend must automatically assign them the Admin role. All other emails default to Standard.
 4. **Version Control:** Initialise a Git repository. Minimum 3 commits for this task. One commit message must contain the word Genesis.
 5. Name the repo IntergalacticCargoPortal - [Your Last Name]
-

End of Task 1 Submission:

- Subject: Update: Task 1 - [Your Last Name] - Auth Ready
- Body: Provide the JSON payload a client would send to your /signup endpoint to successfully trigger the creation of an Admin user. Attach a screenshot or text snippet of your Database Schema.

- Naming screenshot: Task 1 - Screenshot 1 - [Your Last Name] - Auth Ready
-

Task 2: The Core Engine (Uploads)

1. **The Task:** Create a protected POST /api/upload endpoint to accept the manifest.txt file, parse it, and save the records to your database. Create a GET /api/cargo endpoint to fetch them.
2. **Authorisation Rule:** Only Admin users can hit the upload endpoint. If a Standard user attempts it, return a 403 Forbidden status code with the exact message: "Clearance level inadequate."
3. **Processing Rule:** While parsing the uploaded text file:
 - If DESTINATION contains Sector-7, multiply the weight by 1.45.
 - Round the final calculated weight to the nearest whole number. If that number is a **Prime Number**, do not save that record to the database.
4. **Version Control:** Minimum 3 commits for this task. Push code to a public GitHub repository.

End of Task 2 Submission:

- Subject: Update: Task 2 - [Your Last Name] - DB Populated
 - Body: Provide the exact cURL command (including a dummy Auth token/header) that a Standard user would maliciously use to try and hit the upload endpoint, resulting in the 403 error.
 - Attach a screenshot of the error.
 - Naming screenshot: Task 2 - Screenshot 1 - [Your Last Name] - Error
-

Task 3: The Frontend Dashboard

1. **The Task:** Build a frontend (*go creative here*) with a Login/Signup screen. Route the user to a dashboard based on their role after login.
2. **Admin View:** Must see a "File Upload" button and a data table of all cargo.
3. **Standard View:** Must see only the data table. The upload button must not exist in the DOM for them.
4. **Business Rule 2 (Display):** Admins must see the cargo weight displayed in Kilograms (KG). Standard users must see the weight dynamically converted and displayed in Pounds (LBS) (multiply KG by 2.20462).
5. **Business Rule 3 (Sorting):** Sort the table by Weight (Heaviest to Lightest). **Exception:** Any cargo destined for Earth MUST always be pinned to the absolute bottom of the table, regardless of weight.
6. **Version Control:** Minimum 3 commits for this task. Update README.md manually with local setup instructions.

End of Task 3 Submission:

- Subject: Final Submission - [Your Last Name] - Portal Complete
 - Body: Include your GitHub repository link. You must include a link to a short screen recording (Any of Loom, YouTube Unlisted, Google Drive) demonstrating: Logging in as Admin (showing upload & KG), logging out, and logging in as a Standard user (showing no upload, LBS, and Earth pinned to the bottom). Creating a new user.
 - Recording Video in YouTube: Record the video for YouTube with a format where both the demo and the presenter are visible. The screen should display the demo, along with a headshot cutout of the presenter so their face is visible throughout. Share the link of the video in mail, name of the video: Final Submission - [Your Last Name] - Frontend Dashboard.
 - Recording Video in Loom: You can find a guide to recording videos using Loom [here](#), with a format where both the demo and the presenter are visible. The screen should display the demo, along with a headshot cutout of the presenter so their face is visible throughout. Share the link of the video in mail, name of the video: Final Submission - [Your Last Name] - Frontend Dashboard.
